First of all, the Charles' law formula requires the absolute values of temperatures, so that we have to convert them into Kelvin: $T_1 = 35\text{ }^\circ\text{C} = 308.15\text{ K}$, $T_2 = 15\text{ }^\circ\text{C} = 288.15\text{ K}$. Then we can apply the Charles' law equation in the form where the final volume is being evaluated:
 $V_2 = V_1 / T_1 * T_2 = 2\text{ l} / 308.15\text{ K} * 288.15\text{ K} = 1.8702\text{ l}$.

Because policies and regulations are always changing in police agencies, this guide offers timely solutions to problems and situations commonly encountered in the field. Criminal acts with which law enforcement officers must deal range from that of a serial killer or rapist to petty theft and vandalism by juveniles. This book offers case examples together with solutions to promote the best possible action by police. Topics include domestic violence situations, traffic violations, federal offenses, child abuse, sex offenses, hate and bias crimes, and substance abuse as it relates to criminal activity. There are guidelines for search and seizure procedures, dealing with mentally impaired individuals, working with youthful offenders, and protocol for finding wanted and missing persons. Crime scene investigation is explained as well as working in cooperation with other agencies. This book can be used as a training manual for new recruits and as a method for evaluating performance of officers already working in the field.

This manual is meant to provide supplementary material and solutions to the exercises used in Charles Hadlock's textbook, *Mathematical Modeling in the Environment*. The manual is invaluable to users of the textbook as it contains complete solutions and often further discussion of essentially every exercise the author presents in his book. This includes both the mathematical/computational exercises as well as the research questions and investigations. Since the exercises in the textbook are very rich in content, (rather than simple mechanical problems), and cover a wide range, most readers will not have the time to work out every one on their own. Readers can thus still benefit greatly from perusing solutions to problems they have at least thought about briefly. Students using this manual still need to work out solutions to research questions using their own sources and adapting them to their own geographic locations, or to numerical problems using their own computational schemes, so this manual will be a useful guide to students in many course contexts. Enrichment material is included on the topics of some of the exercises. Advice for teachers who lack previous environmental experience but who want to teach this material is also provided and makes it practical for such persons to offer a course based on these volumes. This book is the essential companion to *Mathematical Modeling in the Environment*.
