A Series Circuit has only one path to ground, so electrons must go through each component to get back to ground. All loads are placed in series. Therefore: 1. An open in the circuit will disable the entire circuit. 2. The voltage divides (shared) between the loads. 3. The current flow is the same throughout the circuit. 4.

Electrical Circuits. 22 of 31: PARALLEL CIRCUIT A parallel circuit has more than one path for current flow. The same voltage is applied across each branch. If the load resistance in each branch is the same, the current in each branch will be the same. If the load resistance in each branch is different, the current in each branch will be different.

P4.6 Parallel circuits AQA GCSE Physics P4 Electric Circuits Kerboodle Answers : Page No. 61. $1a \ 3 = 0.40 - 0.10 = 0.30A$. The bigger the resistance of the component, the smaller the current through it. The component that has the biggest resistance passes the smallest current. So the 3ohm resistor passes the most current $c \ 1/R = 1/1+1/2+1/6 = 10/6$

In an electrical circuit, electrical pressure (voltage or volts) pushes electrical volume (current or amps) through the circuit, operating a load. The load may be a computer, a motor, a lamp, a relay or other device. Electrical pressure (voltage) is used up operating the load. Therefore, voltage falls to about zero on the ground side, but ...
