Engine Bore

In a piston engine, the bore (or cylinder bore) is the diameter of each cylinder . Engine displacement is calculated based on bore, stroke length and the number of cylinders: displacement = $\pi (1. / . 2 \times \text{bore})^2 \times \text{stroke} \times \text{ncylinders}$.

How to Measure Cylinder Bore: 12 Steps (with Pictures ...

To do that there are two dimensions in an engine's configuration which determine displacement: the engine's bore and stroke. At the risk of stating the obvious, the bore of the engine is the diameter of the cylinder (and the piston inside of it), while the stroke is the vertical distance the piston travels within the cylinder. There are lots of debates, both in real life and on the internet, about which dimension is worth more power.
