During operation, the pinion makes three complete revolutions for every single revolution of the larger gear. This relationship in which the gear turns at one-third of the pinion speed is a result of the number of teeth on the pinion and the larger gear. This relationship is called the gear teeth – pinion teeth ratio or the gear ratio.

A typical gear ratio for a 20" bmx bike is 2.75:1. This means that the front sprocket is 2.75 times larger than the rear sprocket, or that the rear wheel will make 2.75 rotation for every full rotation of the cranks. The standard for bmx bikes for many years was 44/16. Mathematically, 16 times 2.75 is 44 and 44 divided by 2.75 is 16.

Let's take a 6.4:1 gear ratio fishing reel for an example. In this case, every time you turn the handle of your reel one complete turn – the spool of the reel, which holds the fishing line, makes exactly 6.4 turns. This is due to the output gear (connected to the spool) being bigger than the input gear (connected to the handle).

Choosing the Best Gear Ratio Fishing Reel For You

Most people tend to think that a gear ratio with bigger numbers, like 7.5:1, is a higher gear ratio. But that's not true. The proper terminology for this would be that it is a high-speed gear ratio, not a high gear ratio. Reels having gear ratios with higher numbers are actually geared lower than reels with lower numerical gear ratios.

Understanding Fishing Reel Gear Ratios - Tackle Test

If the gear ratio of gear A to gear B is 4:1, we know the following. The radius, diameter, and circumference of gear A are all four times larger than gear B. We know that the torque on gear A will be four times greater than the torque on gear B. Finally we know that gear A will rotate at one fourth the speed of gear B.
