The attraction between oppositely charged ions is called an ionic bond, and it is one of the main types of chemical bonds in chemistry. Ionic bonds are caused by electrons

Access Free Ionic Bonding

transferring from one atom to another. In electron transfer, the number of electrons lost must equal the number of electrons gained. We saw this in the formation of NaCl.

Kiddy Math

Ionic bonding can be viewed by noting the donation of valence

electrons from a metal atom to a nonmetal atom by using the Bohr model. From this theory, we will

Access Free Ionic Bonding

move on the Lewis structure with an understanding that metals will always lose valence electrons and nonmetals will gain up to eight in order to form stable compounds.
