A site index geographic information system (GIS) layer is being developed for British Columbia so that estimated site indices are available for the major commercial tree species across their ranges. The Site Index - Biogeoclimatic Ecosystem Classification (SIBEC)/predictive ecosystem map (PEM)/terrestrial ecosystem map (TEM) method will be used to populate the layer with site index by species. However, there will be gaps in the layer where there are no PEM/TEM or SIBEC data. The biophysical models resulting from this project will be used to fill these gaps. They predict, by species, site index from biogeoclimatic zone, slope, aspect, elevation, and climate variables. Data for these models come from the SIBEC project and various Site Index Adjustment projects. The climate variables are predicted from the ClimateWNA model. A biophysical model was fit separately for the following species: trembling aspen (*Populus tremuloides*), amabilis fir (*Abies amabilis*), subalpine fir (*Abies lasiocarpa*), western redcedar (*Thuja plicata*, coastal and interior), paper birch (*Betula papyrifera*), Douglas-fir (*Pseudotsuga menziesii*, coastal and interior), western hemlock (*Tsuga heterophylla*, coastal and interior), western larch (*Larix occidentalis*), lodgepole pine (*Pinus contorta*), ponderosa pine (*Pinus ponderosa*), black spruce (*Picea mariana*), Engelmann spruce (*Picea engelmannii*), Sitka spruce (*Picea sitchensis*), white spruce (*Picea glauca*), and interior spruce (white spruce, Engelmann spruce, or their cross). When compared to benchmark models, the biophysical models performed about as well as the benchmark except for the models for coastal western redcedar, coastal Douglas-fir, coastal western hemlock, Sitka spruce, and paper birch.

Effective fitness instruction and training programme design require an exercise specialist trainer to combine professional experience with strategies underpinned by scientific evidence. This is the first comprehensive fitness instruction and training programme design resource to explore the evidence-base of effective programme design, drawing on cutting-edge scientific research to identify optimum training methods and dispel some common myths around fitness training. Putting clients' training goals at the centre of the process by focusing on their most common objectives – such as improving general health, enhancing cardiorespiratory fitness, decreasing body fat and increasing muscle mass – this book helps

the reader develop a better understanding of the physiological principles at the core of successful programme design. Simple to navigate and full of helpful features – including applied case studies, example training programmes and guides to further reading – it covers a variety of key topics such as: pre-exercise health screening lifestyle and fitness assessment nutrition cardiorespiratory (endurance), resistance and core training recovery from exercise. An essential text for fitness instructors, personal trainers and sport and exercise students, this book provides an invaluable resource for fitness courses, exercise science degree programmes and continued professional development for exercise professionals.

Conditional Cash Transfer (CCT) programs aim to reduce poverty by making welfare programs conditional upon the receivers' actions. That is, the government only transfers the money to persons who meet certain criteria. These criteria may include enrolling children into public schools, getting regular check-ups at the doctor's office, receiving vaccinations, or the like. They have been hailed as a way of reducing inequality and helping households break out of a vicious cycle whereby poverty is transmitted from one generation to another. Do these and other claims make sense? Are they supported by the available empirical evidence? This volume seeks to answer these and other related questions. Specifically, it lays out a conceptual framework for thinking about the economic rationale for CCTs; it reviews the very rich evidence that has accumulated on CCTs; it discusses how the conceptual framework and the evidence on impacts should inform the design of CCT programs in practice; and it discusses how CCTs fit in the context of broader social policies. The authors show that there is considerable evidence that CCTs have improved the lives of poor people and argue that conditional cash transfers have been an effective way of redistributing income to the poor. They also recognize that even the best-designed and managed CCT cannot fulfill all of the needs of a comprehensive social protection system. They therefore need to be complemented with other interventions, such as workfare or employment programs, and social pensions.

Descriptions, maps, illustrations and tables of British Columbia's biogeoclimatic zones, as well as an overview of how the biogeoclimatic zone system was developed.

What is autophagy? Why would neurons or other brain cells digest parts of themselves through autophagy? How can autophagy save the lives of cells under some conditions, but act as a culprit or accomplice to cell death in others? How does dysfunction of autophagy contribute to neurological diseases and can it be repaired or restored? This book addresses these questions and provide an expert view of the emerging concepts in autophagy research, focusing on autophagic processes and regulation in neurons. Current experimental evidence for both evolutionarily conserved and specialized regulatory mechanisms for autophagy in the mammalian nervous system will be presented. Advances in our understanding of the complex interplay of autophagy induction and downregulation will be discussed in relation to the critical balance needed to modulate neuroprotection versus neurodegeneration in the context of neurological diseases including Alzheimer's, Parkinson's, Huntington's, ischemic-hypoxic and lysosomal diseases.

What happens to "orphan" diseases that aren't big enough profit centers for the pharmaceutical industry or get caught in the web of government funding and academic research? Augie Nieto found out in the spring of 2005: At forty-seven years old he was diagnosed with ALS. Devastated, Augie struggled with depression and attempted suicide. When he awoke from a coma, with friends and family surrounding him, his sense of faith and mission were renewed. Fast-forward one year: Augie and his wife, Lynne, were profiled as "Real Heroes" on the Today show. Their determination to beat the disease had already led to major overhauls in the way ALS research was conducted. In partnership with the Muscular Dystrophy Association, Augie had set up a foundation and lab to coordinate and oversee ALS research and testing across the globe. By centralizing operations and championing an entrepreneurial approach to medical research, Augie and his team accomplished remarkable results in less than two years. Part inspiration, part business innovation, Augie's Quest illustrates how one person can make a meaningful difference. Praise for Augie Nieto: George H. W. Bush, former U.S. president: "Your contributions to the fitness industry are well known, and your dedication an inspiration." Lance Armstrong, seven-time "Le Tour de France" champion: "I think it says a lot about Augie, the fact that everybody came together regardless of whether or not it's for competing gyms or competing companies that make equipment. They all say, this is one of our own; this is a guy who's committed his life to our industry and has been dealt a serious blow. We're going to be there for him, we're going to say, we're here for you and we're part of the Quest." Arnold Schwarzenegger, governor of California: "Your success has been incredible. But you are so much more than just a successful businessman. You are the greatest husband, a great father, and a terrific friend. So,
