Synopsis. In this volume the underlying logic and practice of maximum likelihood (ML) estimation is made clear by providing a general modelling framework that utilizes the tools of ML methods. This framework offers readers a flexible modelling strategy since it accommodates cases from the simplest linear models to the most complex nonlinear models that link a system of endogenous and exogenous variables with non-normal distributions.

In statistics, maximum likelihood estimation (MLE) is a method of estimating the parameters of a probability distribution by maximizing a likelihood function, so that under the assumed statistical model the observed data is most probable. The point in the parameter space that maximizes the likelihood function is called the maximum likelihood estimate. The logic of maximum likelihood is both ...

Intuitive explanation of maximum likelihood estimation. Maximum likelihood estimation is a method that determines values for the parameters of a model. The parameter values are found such that they maximise the likelihood that the process described by the model produced the data that were actually observed. The above definition may still sound a little cryptic so let's go through an example to help understand this.

Maximum likelihood estimation (MLE) is a technique used for estimating the parameters of a given distribution, using some observed data. For example, if a population is known to follow a normal distribution but the mean and variance are unknown, MLE can be used to estimate them using a limited sample of the population, by finding particular values of the mean and variance so that the observation is the most likely result to have occurred.

The critical points of a function (maxima and minima) occur when the first derivative equals 0. If the second

Maximum likelihood estimation (MLE) The regression coefficients are usually estimated using maximum likelihood estimation . [27] [28] Unlike linear regression with normally distributed residuals, it is not possible to find a closed-form expression for the coefficient values that maximize the likelihood function, so that an iterative process must be used instead; for example Newton's method .

OLS can be used to estimate the linear regression model and its cousin (weighted least squares) can be used for more sophisticated linear regression models. Nevertheless, in many application we need a more powerful estimation technique. This technique is Maximum Like-lihood Estimation. With MLE we can estimate many models and especially
