Seismic Design Factors. The following factors affect and are affected by the design of the building. It is important that the design team understands these factors and deal with them prudently in the design phase. Torsion: Objects and buildings have a center of mass, a point by which the object (building) can be balanced without rotation occurring. If the mass is uniformly distributed then the geometric center of the floor and the center of mass may coincide.

Eurocode 8: an introduction to seismic design of buildings ...

Earthquakes often induce non-linear response in structures. However, the most practical seismic design continues to be based on linear analysis. The effect of non-linearity is generally to reduce the seismic demands on the structure, and this is normally accounted for by a simple modification to the linear analysis procedure.
