Self-healing materials are artificial or synthetically-created substances that have the built-in ability to automatically repair damages to themselves without any external diagnosis of the problem or human intervention. Generally, materials will degrade over time due to fatigue, environmental conditions, or damage incurred during operation. Cracks and other types of damage on a microscopic ...

Self-healing material - Wikipedia

Self-healing materials, which are inspired by the repair functionality of biological systems, increasingly incorporate microvascular components as an approach to mimic the autonomic healing abilities of biological organisms. Synthetic microvasculature addresses the limitations in healing agent availability within microcapsule-based systems in order to achieve multiple healing events at a particular damage location, and to repair large-scale fracture damage.
