Trigonometric Limits Problems and Solutions.

The limits problems are often appeared with trigonometric functions. To find limits of functions in which trigonometric functions are involved, you must learn both trigonometric identities and limits of trigonometric functions formulas. Here is the list of solved easy to difficult trigonometric limits problems with step by step solutions in different methods for evaluating trigonometric limits in calculus.

Solution : Now we need to find the height of the side AB.  $\sin \theta = \frac{\text{Opposite side}}{\text{Hypotenuse side}}$ .  $\sin \theta = \frac{AB}{AC}$ .  $\sin 60^\circ = \frac{AB}{100}$ .  $\frac{\sqrt{3}}{2} = \frac{AB}{100}$ .  $(\frac{\sqrt{3}}{2}) \times 100 = AB$ .  $AB = 50\sqrt{3}$  m. So, the height of kite from the ground  $50\sqrt{3}$  m.

Here we have an angle, 12 degrees, and know the adjacent side (6 km) and we want to know the length of the opposite side (O). The formula that will help us is the tangent: Substituting in the appropriate values, Rearranging to isolate O,  $O = \tan(12) \cdot 6\text{km}$ . Using a calculator, the value of  $\tan(12)$  is 0.213. So.
